Office Action Response – February 16, 2006

Amendments

In the Claims:

- 1 1. (Currently Amended) A memory system, comprising:
  - 2 a first storage device;
  - 3 at least one additional storage device;
  - 4 a control storage device to store a programmable indicator identifying the
  - 5 manner in which the first and the at least one additional storage device are to be
  - 6 referenced; and
  - 7 a control circuit coupled to the first storage device, the at least one additional
  - 8 storage device, and the control storage device, the control circuit to receive a
  - 9 request for data, wherein copies of the requested data may be stored within at least
  - 10 one of the first or and the at least one additional storage device, and in response
  - 11 thereto the request, to attempt to retrieve the requested data by initiating, based
  - 12 on the state of the programmable indicator, initiate at least one of a first reference to
  - 13 the first storage device and a second reference to the at least one additional storage
  - 14 device in a manner controlled by the state of the programmable indicator.
2. (Original) The system of Claim 1, wherein the first and the second references are issued in a time order that is controlled by the state of the programmable indicator.

Office Action Response – February 16, 2006

1 3. (Original) The system of Claim 1, wherein if the programmable indicator is in  
2 a first state, the second reference is issued only if the first reference is not capable  
3 of completing the request.

1 4. (Original) The system of Claim 3, wherein if the programmable indicator is in  
2 a second state, the second reference is issued regardless of whether the second  
3 reference is required to complete the request.

1 5. (Original) The system of Claim 4, wherein if the programmable indicator is in  
2 the second state, the second reference is issued before the first reference.

1 6. (Original) The system of Claim 1, and further including mode switch logic to  
2 modify the state of the programmable indicator between the first state and the  
3 second state based on programmable criteria.

1 7. (Original) The system of Claim 6, wherein the control circuit receives multiple  
2 requests for data, and wherein the mode switch logic includes a circuit to modify the  
3 state of the programmable indicator from the first state to the second state if at least  
4 a first predetermined number of the multiple requests requires the second reference  
5 to complete.

1 8. (Original) The system of Claim 7, wherein the mode switch logic includes a  
2 circuit to modify the state of the programmable indicator from the second state to the

Office Action Response – February 16, 2006

3    first state if a second predetermined number of the multiple requests does not  
4    require the second reference to complete

1    9.    (Original) The system of Claim 8, wherein the mode switch logic includes a  
2    circuit that allows at least one of the first and the second predetermined numbers to  
3    be programmably selected.

1    10.   (Original) The system of Claim 8, and further including a main memory  
2    coupled to the first storage device to issue the request to the control circuit.

1    11.   (Original) The system of Claim 10, wherein the request is requesting data  
2    associated with one or more incomplete memory coherency actions, and further  
3    comprising a request tracking circuit coupled to the control circuit to track the  
4    incomplete memory coherency actions, whereby the data is returned to the main  
5    memory only after all of the coherency actions are completed.

1    12.   (Currently Amended) A memory system, comprising:  
2        first memory logic;  
3        at least one other memory;  
4        a storage device coupled to the first memory logic to store a programmable  
5        indicator identifying a mode of referencing the first memory logic and the at least one  
6        other memory; and

Office Action Response – February 16, 2006

7        a control circuit coupled to the first memory logic and the at least one other  
8        memory, the control circuit to receive a request for data, copies of which may be  
9        resident within the first memory logic and the at least one other memory, and in  
10      response thereto, to determine based on the identified mode whether to attempt to  
11      retrieve the requested data from at least one of the first memory logic, and the at  
12      least one other memory, or both the first memory logic and the at least one other  
13      memory in a manner determined by the identified mode.

15

1        13. (Original) The system of Claim 12, wherein the first memory logic includes at  
2        least one of a tag memory and a memory to store data.

1        14. (Original) The system of Claim 12, wherein the control circuit includes a circuit  
2        to determine whether the programmable indicator is in a first predetermined state,  
3        and if so, to further determine whether the at least one other memory must be  
4        referenced to complete the request, and if not, to obtain the data from the first  
5        memory logic without reference to the at least one other memory.

1

2        15. (Original) The system of Claim 14, wherein the control circuit includes a  
3        circuit to initiate references to both the first memory logic and the at least one other  
4        memory if the at least one other memory must be referenced to complete the  
5        request.

2 16. (Original) The system of Claim 12, wherein the control circuit includes a  
3 circuit to determine whether the programmable indicator is in a second  
4 predetermined state, and if so, to initiate a reference to the first memory logic and  
5 the at least one other memory irrespective of whether a reference to the at least one  
6 other memory is necessary to complete the request.

1 17. (Original) The system of Claim 12, wherein the control circuit includes a  
2 circuit to determine if the programmable indicator is in a third predetermined state  
3 indicating the first memory logic is unavailable for storing data, and if so, to initiate a  
4 reference to the at least one other memory without attempting to obtain the  
5 requested data from the first memory logic.

1 18. (Original) The system of Claim 12, wherein the first memory logic includes a  
2 shared cache, wherein the at least one other memory includes one or more  
3 dedicated caches, and further comprising at least one instruction processor coupled  
4 to the one or more dedicated caches

1 19. (Original) The system of Claim 12, and further comprising a main memory  
2 coupled to the first memory logic to issue the request for the data.

1 20. (Original) The memory system of Claim 12, and further including mode  
2 switch logic coupled to the storage device to automatically re-program the  
3 programmable indicator.

Office Action Response – February 16, 2006

1 21. (Original) The memory system of Claim 20, wherein the mode switch logic  
2 includes a circuit to monitor conditions within the memory system, and to  
3 automatically re-program the programmable indicator based on the monitored  
4 conditions.

1 22. (Currently Amended) A method for use in a data processing system having a  
2 first memory coupled to at least one other memory and a programmable storage  
3 device, the programmable storage device to identify a reference mode to control the  
4 manner in which data is retrieved from at least one of the first memory and the at  
5 least one other memory, the method comprising:

6 a.) receiving a request for data, copies of which may be stored within at least  
7 one of the first memory and the at least one other memory; and  
8 b.) based on the reference mode, initiating an operation to attempt to retrieve  
9 the requested data from at least one of the first memory, or the at least one other  
10 memory, or from both the first memory and the at least one other memory in a  
11 manner that is determined by the reference mode.

1 23. (Original) The method of Claim 22, wherein step b.) comprises:  
2 if the reference mode selects a first mode, determining whether the request  
3 can be completed without accessing the at least one other memory; and

Office Action Response – February 16, 2006

4           If the request can be completed without accessing the at least one other  
5        memory, obtaining the requested data from the first memory.

1   24.   (Original) The method of Claim 22, wherein step b.) comprises:  
2           If the reference mode selects a first mode, determining whether the request  
3        can be completed without accessing the at least one other memory; and  
4           if the request cannot be completed without accessing the at least one other  
5        memory, initiating references to the first memory and the at least one other memory  
6        to complete the request.

1   25.   (Original) The method of Claim 22, wherein if the reference mode selects a  
2        second mode, initiating a reference to the first memory and the at least one other  
3        memory irrespective of which of the first memory or the at least one other memory  
4        stores the data.

1   26.   (Original) The method of Claim 22, wherein step b.) comprises:  
2           determining that the first memory is unavailable to store the requested data;  
3        and  
4           obtaining the requested data from the at least one other memory.

1   27.   (Original) The method of Claim 22, and further including modifying the  
2        reference mode based on conditions within the data processing system.

Unisys Corporation Docket No. RA-5487

Examiner Lev Iwashko, Group Art Unit 2186  
Office Action Response – February 16, 2006

1 28. (Original) The method of Claim 22, wherein the data processing system  
2 includes a main memory coupled to the first memory, and wherein step a.) includes  
3 receiving a request for data from the main memory.

1 29. (Original) The method of Claim 22, wherein the at least one other memory  
2 includes multiple coupled memories, and wherein step b.) comprises:  
3 issuing a request for the requested data to the multiple coupled memories;  
4 and  
5 receiving the requested data from one of the multiple coupled memories.

1 30. (Currently Amended) A data processing system, comprising:  
2 main memory means for storing data;  
3 first cache means for storing a first sub-set of the data;  
4 second cache means for storing a second sub-set of the data;  
5 programmable storage means for storing one or more control signals to  
6 control the way in which data is retrieved from the first cache means and the second  
7 cache means; and  
8 control means for receiving requests for data from the main memory means  
9 requesting return of data, the control means further for initiating a reference to  
10 retrieve the data from to one or both of the first and second cache means based, at  
11 least in part, on the state of the one or more control signals.

Unisys Corporation Docket No. RA-5487

Examiner Lev Iwashko, Group Art Unit 2186  
Office Action Response – February 16, 2006

1 31. (Original) The system of Claim 30, and further including mode switch means  
2 for monitoring system conditions and automatically altering one or more of the  
3 control signals based on the system conditions.

1 32. (Original) The system of Claim 30, wherein the first cache means includes  
2 tag means for storing tag information describing the first sub-set of the data; and  
3 wherein the control means includes means for initiating a reference to one or both of  
4 the first and the second cache means based, at least in part, on tag information for  
5 the requested data.
